

# Impact of Robotic Surgery on Data-driven care delivery

Mr. Rajesh Sivaprakasam FRCS

Robotic Renal Failure Surgeon and Med.Entrepreneur  
Bartshealth NHS trust. London. UK

# Positions

Consultant Robotic Renal Failure Surgeon, Lead for Robotic Renal Failure Surgery, Research and Education

Educator & Mentor - Year-5, Queen Mary University of London & Surgical Trainees

Examiner & Director - Royal College of Surgeons (Intercollegiate)

Ambassador for Patient charities and groups

Member of All Party Parliamentary group for health equality

Enable integration of innovation-based solutions into care delivery

Advisory Board for Healthcare technology companies

# Our projects

## Hardware

Alio Smart Patch for remote renal care (CI)

Point of care ultrasound (CI)

ACCESS- 2 Sirolimus Patch (CI)

Enhance Robotic & Micro-surgical training (CI)

## Software

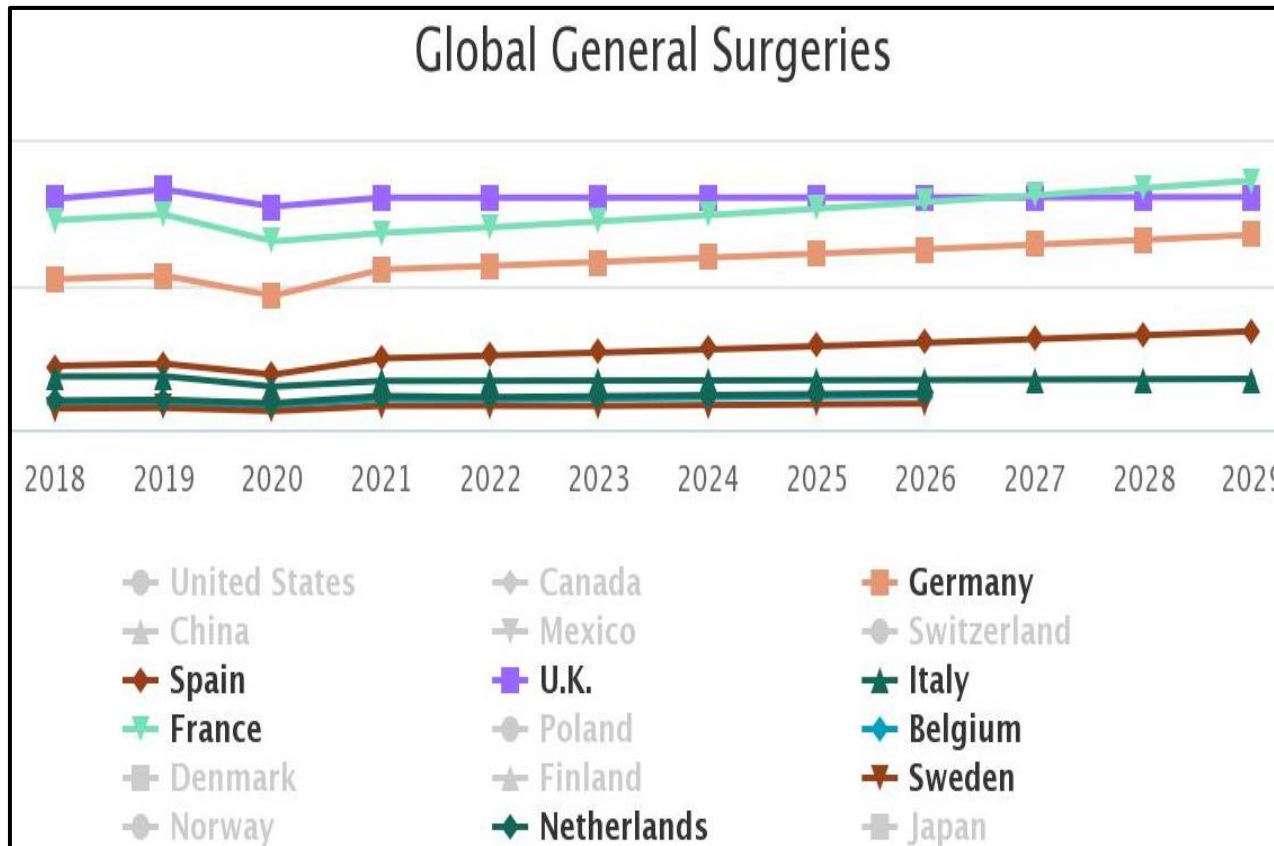

Siri/Alexa for Renal failure (PI)

VR/Metaverse-based Staff & Patient Education (PI)

Enhanced Teleconsultation (CI)

i-BOX : Kidney transplant follow-up (PI)

# How are we ?

# Changing roles

## Nurses

## Doctors

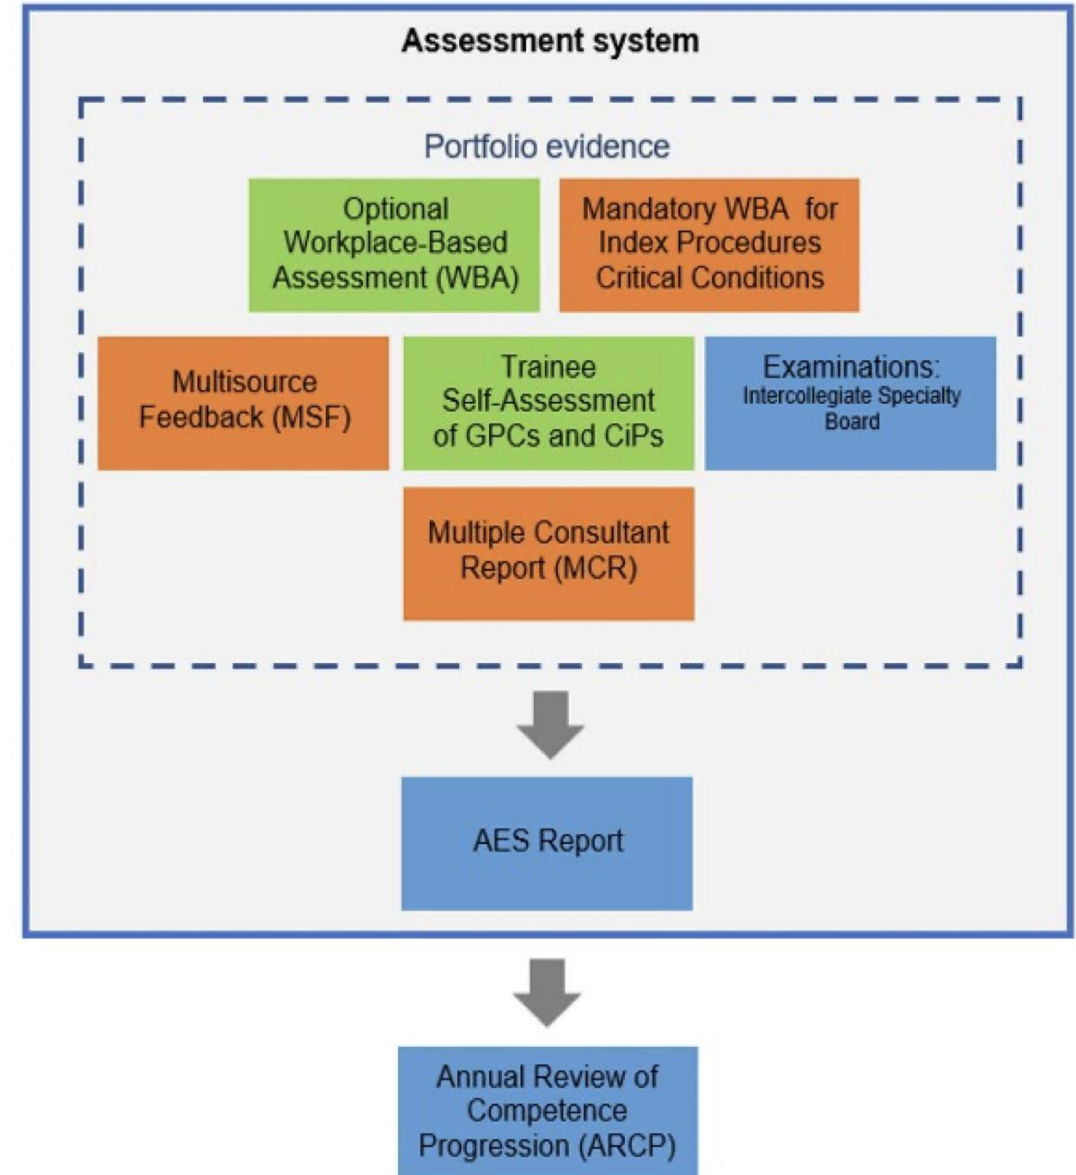

# Training – Present status

## Strengths

- Structured
- Well-organised
- Approved assessment process
- A national approach
- Easy to benchmark

## Challenges

- Single time point assessment
- Number based & Time-consuming
- Mostly Subjective
- Less focus on wellbeing

# Care delivery

- Broad target led
- Mostly static than agile
- Limited Recognition of the need and opportunity of data-driven measures
- Lack of continuity and less inclusive

# Robotic Surgery

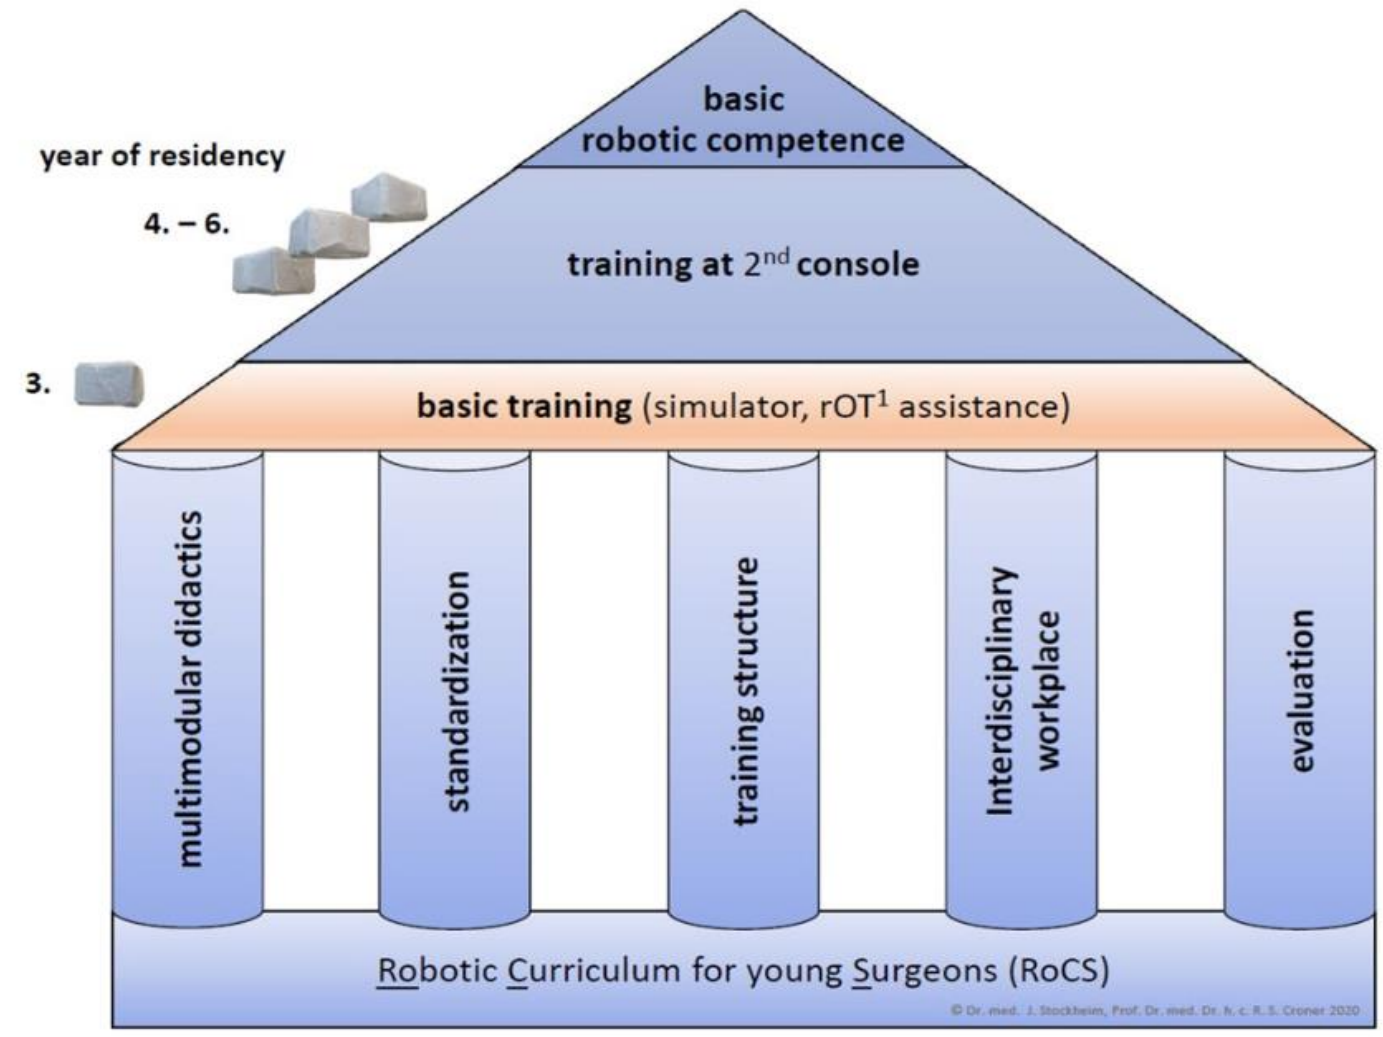

## Staff competency

- Technical skills
- Soft skills

## Progression

## Organisation

- Patient safety
- Scheduling
- Theatre efficiency
- Human factors

# Bartshealth Multispeciality Robotic Programme

- 4.5 years old
- Seven teams
- Gynaecology, Urology, thoracic, Colo-rectal, HPB, ENT and Transplant.
- Developed many combined surgical care delivery models

- Clinical
- Research & Innovation
- Training
- Efficiency

# The need

Recognise

Understand

Enhance

Integrate & Future proof

# Dynamic Patient care

## Old world

Current monitoring

All-in-one, noninvasive, clinical grade, RPM

★ FDA Cleared\*

Heart rate (BPM)

Skin temperature (°C/°F)

Auscultation

Hemoglobin (g/dl)

Hematocrit (%)

Potassium Indicator – World's first

## Detects AVF/G

**Flow rates (< 1L/min)- 100% sensitivity & 75% specificity.**

**Stenosis (>50%) - 100% sensitivity & specificity.**

# Robot assisted surgery- refine surgical training

## **Data collected:**

Patient demographics, BMI, Previous surgery, Complexity of the procedure, Duration of the procedure ,30 days outcome following surgery

## **Use of device:**

Setting up - Time to set & dock the device

Ease of use - Duration of surgery & time to undock

Team training

Impact of the device on the surgeon was measured using *The Surgery Task*

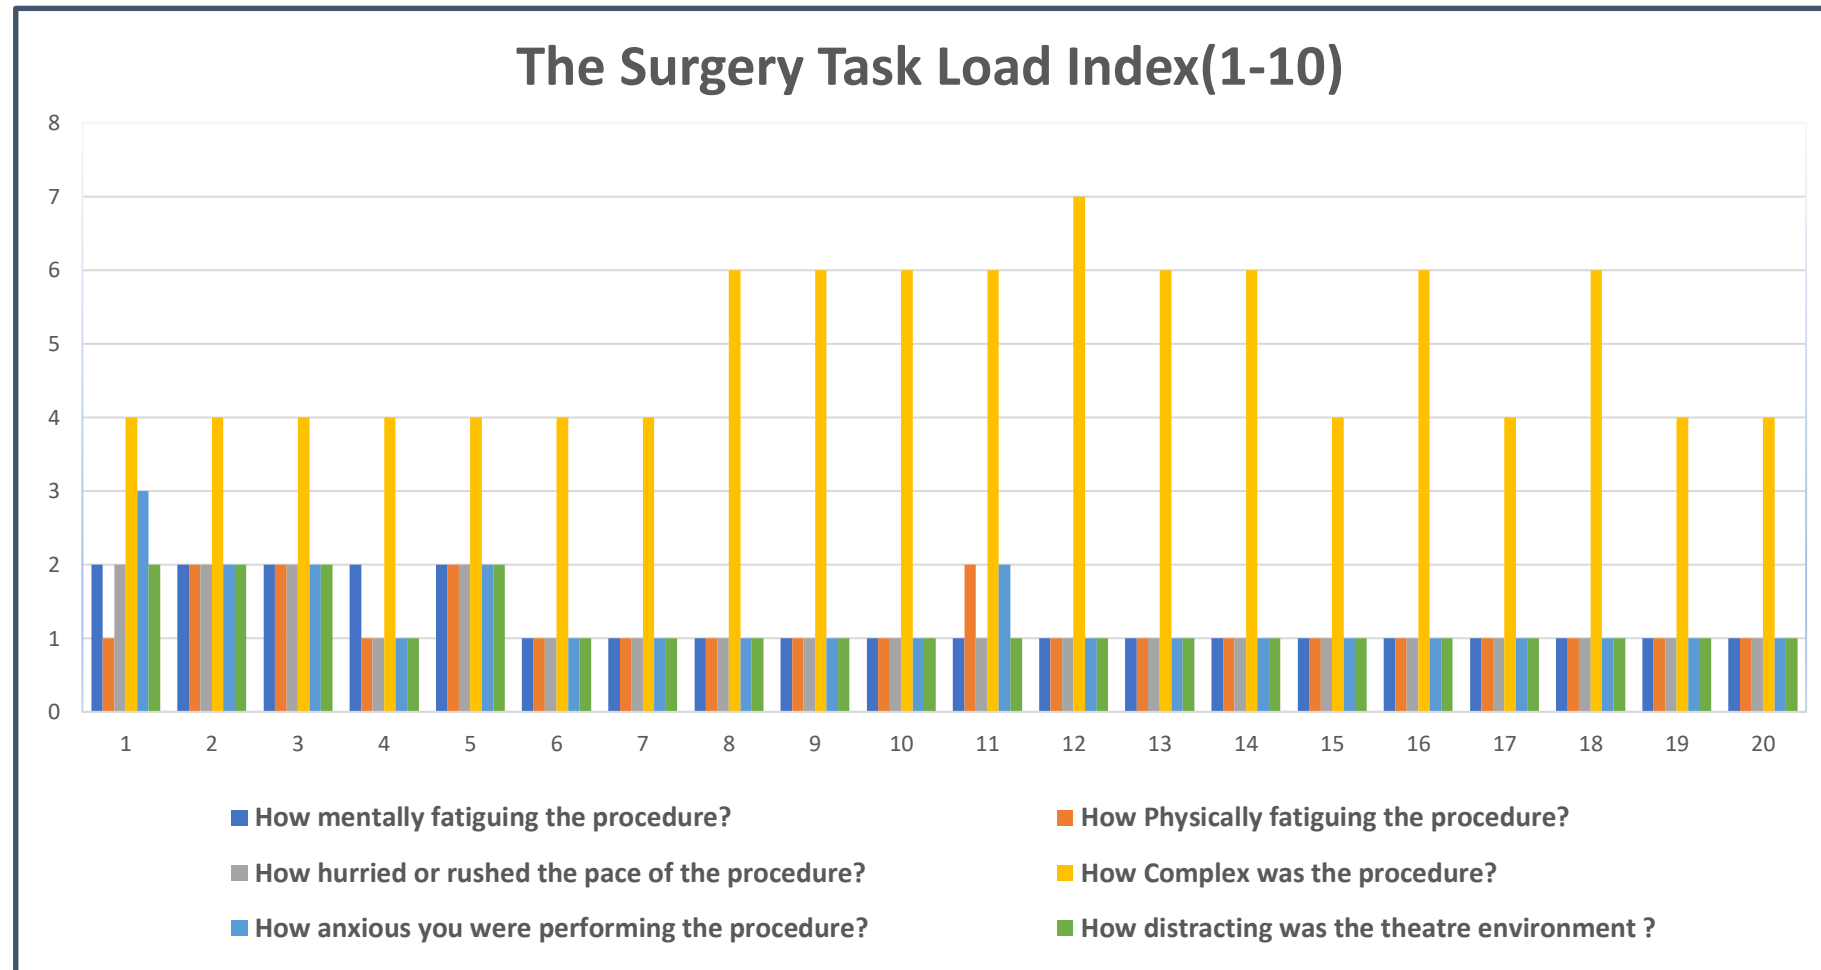

*Load Index (Low to high)*

# Results

Use of the device	With Freehand assist	With Surgical assistant
<b>Setting up</b>		
Time to set (mean)	3.5 minutes	2.5 minutes
Time to dock (mean)	2.6 minutes	1.8 minutes
<b>Ease of use</b>		
Time to undock (mean)	14.5 minutes	21.5 minutes
Duration of Surgery	20.6 minutes	25.8 minutes
<b>Total duration of procedure</b>	<b>24.5 minutes</b>	<b>31.5 minutes</b>

Despite the need for setting up the device, the **total operating time is shorter.**

# Results - Impact of the device on the Surgeon

With three exercises with this robot (single arm) all team members were proficient to use the device.

# Wellness - pilot work (non-invasive)

Tests			
Heart rate & HRV			
Respiratory rate			
Pulse-Resp Quotient	4-5 (normal)		
Stress Level (Beverky index)	low, normal, mild, high, very high		
Response to stress	Low	Normal	High
Recovery ability	Low	Normal	High

## Overall score

# Summary

Robot assisted surgery is transforming patient care, training and operational performance.

Facilitates Integration & delivery of a data-driven service.

Improves engagement patients & all stakeholders towards technology inclusive clinical care.
