## Engineering Reliability for Clinical Environments

World Summit AI 2025  
Michel Abdel Malek MD  
Founder/CEO Delphyr

# Delphyr

**an agentic platform**

**built for clinical workflows**

**to reduce time, regain efficiency and  
improve well being of staff and patients**

# Clinical Administrative Tasks

**Ambient  
Listening**  
With Patient  
[10%]

**We started  
here**

[Finding data,  
Generating Insight  
Writing notes]  
90%

## Requirements/Constraint

- Fit in legacy electronic health record **S**ystems
- Fit in legacy data models (or lack thereof)
- Fit in legacy hospital infrastructure
  
- Fit in highly regulated markets
- Fit in data and patient privacy
  
- Robust, predictable, repeatable outcomes
- Safe and ethically built
- Environment-friendly
- etc

**How do you build reliable GenAI systems in  
given the legacy constraints?**

**Robust Retrieval &  
Reduction of Hallucinations**

# Challenges in working with real world clinical data

Lack of proper metadata  
Structured vs Unstructured  
Information is context dependent  
Contextual terminology  
Missing notes

# How difficult ~~can it be~~ is it?

SOTA Semantic Retrieval Recall @ 5: 55-65% (EHR Benchmark)

# Breaking down the retrieval pipeline

Evals

Expansion - Enrichment - Classification - Indexing

Chunking - Embeddings - Graphs

Query Understanding - Query Routing - Reranking

# Delphyr's Retrieval Performance

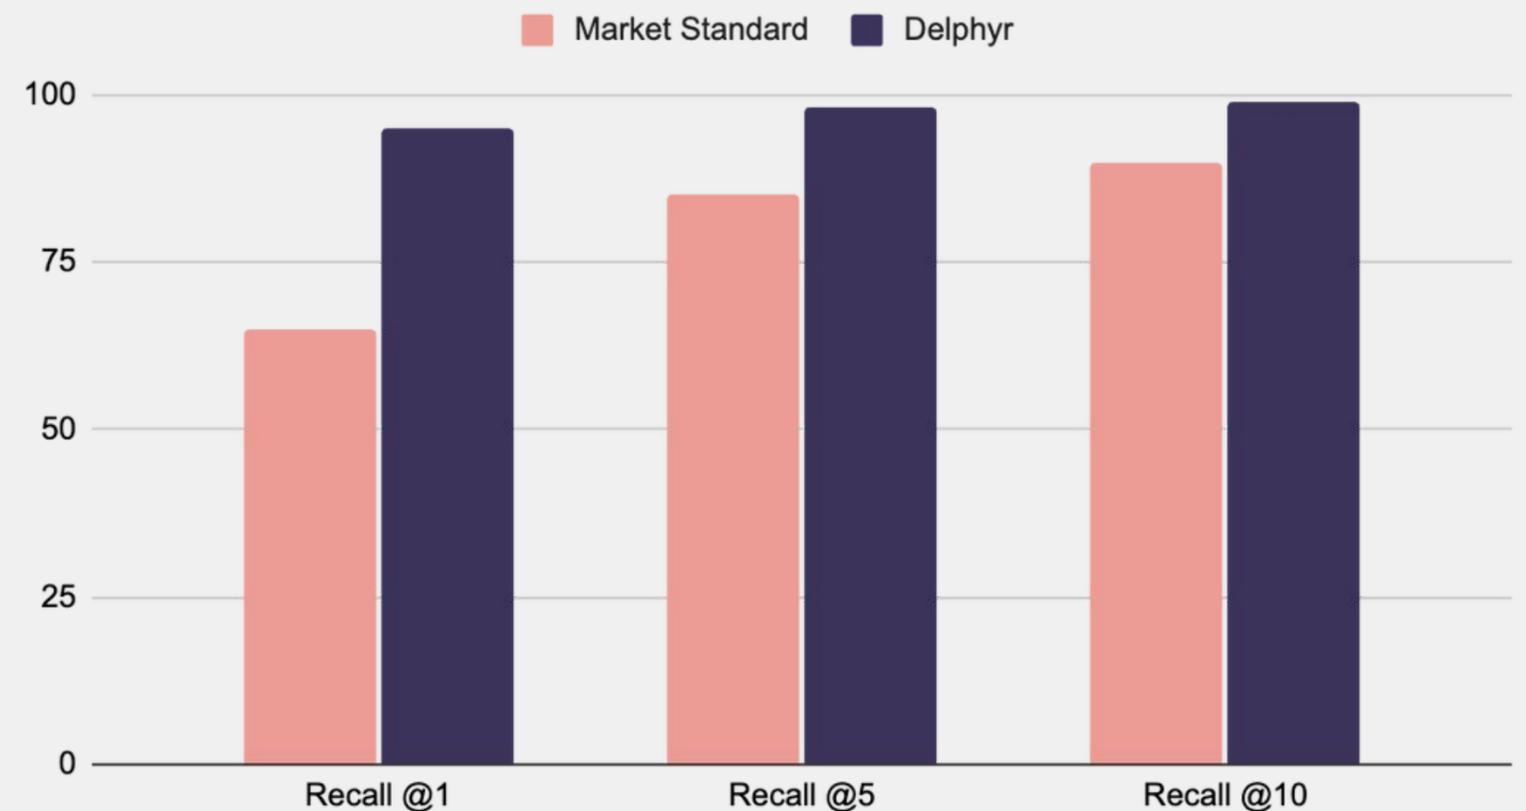

Delphyr's clinical retrieval platform is till date still the best performing retrieval platform for clinical data.

(Recall@1 95%, Recall@5 98%)

Did we overengineer it? Probably.

Is it robust? Yes.

EHR Retrieval Scores (in-house benchmark)

# Reducing hallucinations

# Hallucinations in Clinical AI

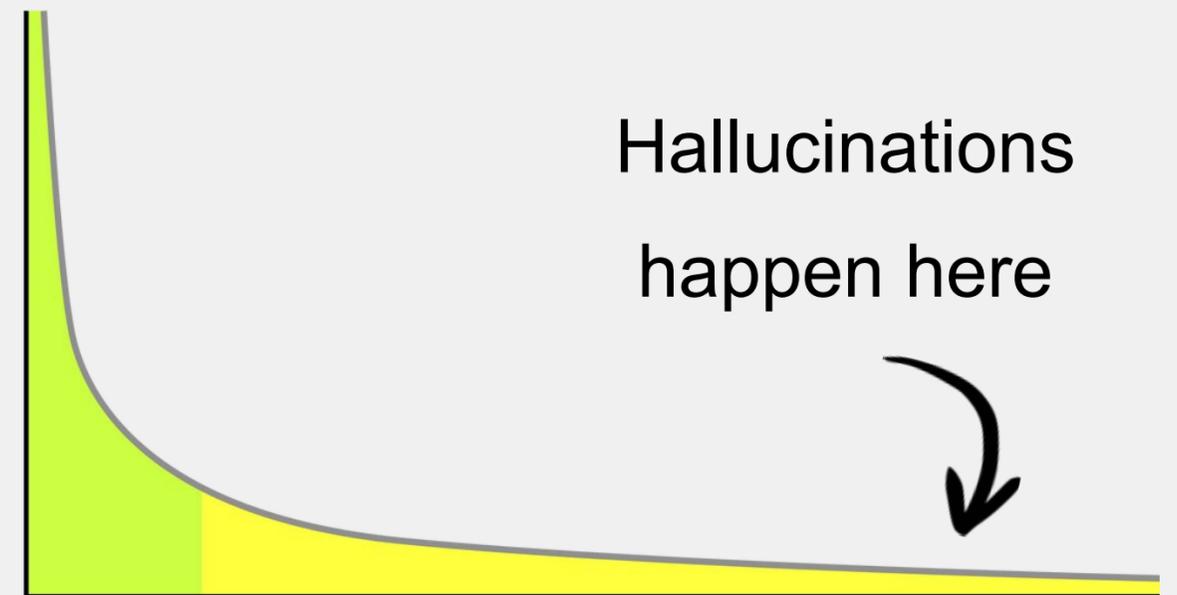

Hallucinations are a fundamental feature/bug of LLMs.

Long-tail occurrences

Compression Failures

Lack 'metacognition'

*"Just put the temperature on 0"*

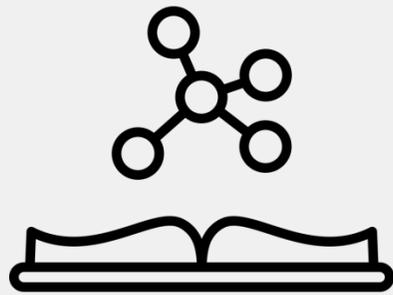

Hallucinations  
happen here

Delphyr

## **Delphyr mitigates hallucinations at system level**

**Detection rate 3-6%**  
**Hallucination rate < 1 %.**

# Thoughts on clinical reasoning

# Clinical Reasoning

The cognitive process used to assess and manage a patient's medical condition with the universal goal to improve outcome for the patient.

Universal Reward-modeling is not straight forward, so subdivide into Diagnostic, Therapeutic, Procedural

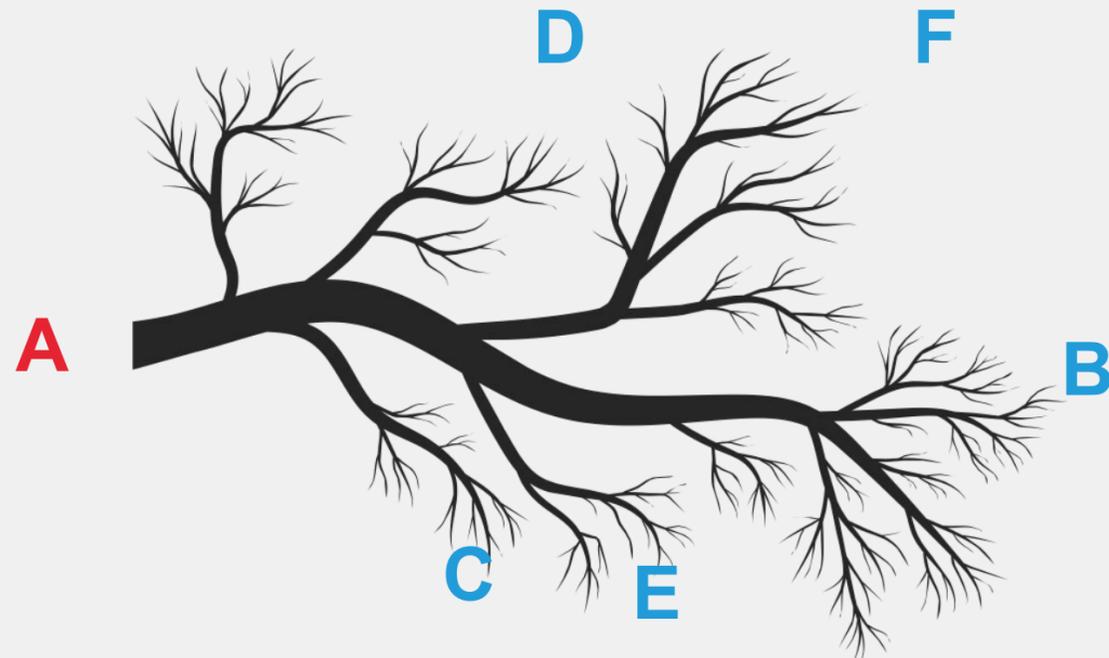

# Clinical Reasoning According To:

Engineers

Doctors

Clinicians switch effortlessly between different strategies:

Heuristics, probabilistic, formal, and pathophysiological reasoning.

# Does Clinical Reasoning resemble

## retrieval-augmented

## generation?

*We now understand much of clinical reasoning as **information processing** and **retrieval**, given the way that expert knowledge is stored in scripts and schemas and activated when given clinical problems.*

Prof. Eric Topol, The Lancet, 2024

Should we train algorithms how to  
correctly predict a diagnosis,  
  
or how to make decisions?

# Delphyr

## Q&A
